

Screen

↳ screen type

↳ LCD = character display

↳ dot matrix

↳ graphical display ↳ colored display.

Display type

↳ led

↳ segment

↳ screen

↳ LCD → liquid crystal display

↳ size 16x2

↳ pin out

↳ Block Diagram + Component

↳ work flow

↳ How communicate

↳ Commands

Pinout

① Power

① gnd → Vss → 0V

② Vcc → VDD → 5V

③ V_E → Pot

② Control

① Rs → Register select

↳ Data For display

↳ Command For lcd

② R/w → Read/write

③ $E \rightarrow EN \rightarrow E_{\text{enable}}$

↳ Enable High → Enable low

Pulse

③ Data Pin :- Data / Command

* $D_0 \rightarrow D_7 \Rightarrow 8 \text{ bit} \rightarrow \underline{8} \text{ bit Mode}$

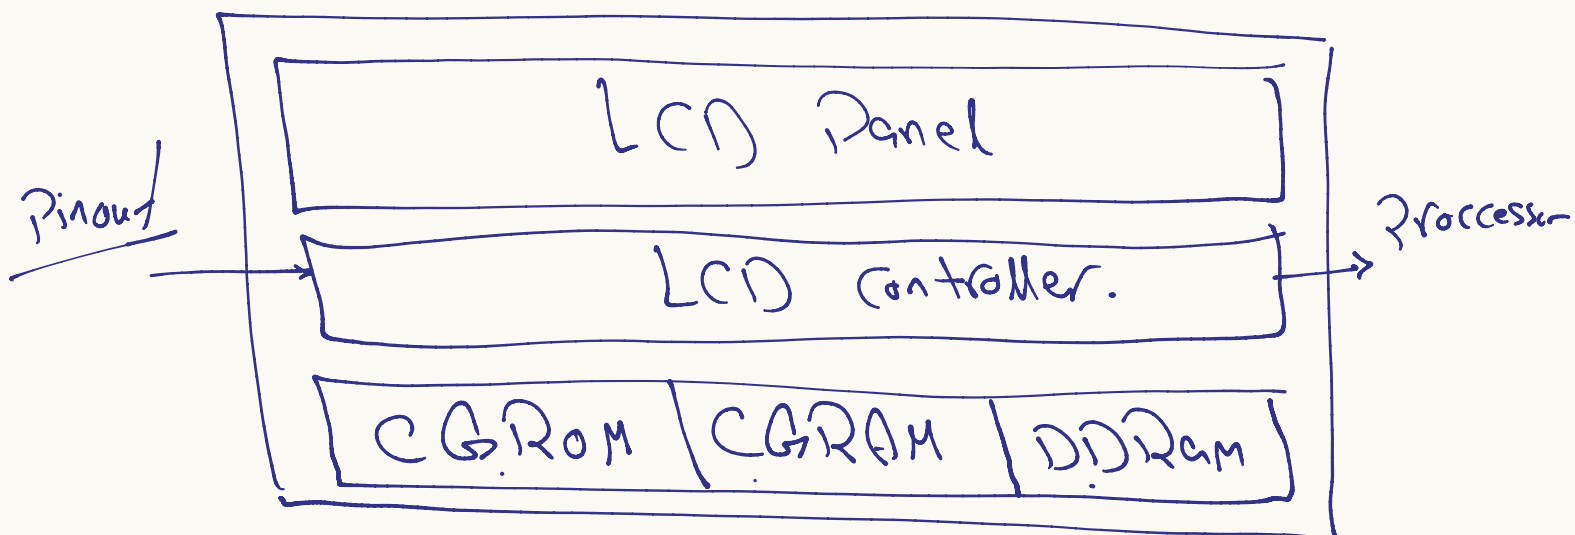

* $D_4 \rightarrow D_7 \Rightarrow 4 \text{ bit} \rightarrow \underline{4} \text{ bit Mode}$

④ Back source light

$$SU(4) \rightarrow SU$$

led- \longrightarrow or

Lcd Block Diagram

$16 \times 2 \Rightarrow$ $16 \rightarrow$ No of display digit
 $2 \rightarrow$ No of line

DDRAM

↳ Display Data Ram (volatile memory)

↳ store for data represent in 8 bit character

↳ start Address $\rightarrow 0x00$

→ CGRAM ! Character Generating Ram.

↳ save patterns for all characters

CGRAM → RAM memory store new character

↳ must send Draw way for char

Work Flow

→ need to send Command From MCU

① → RS → Low → 0 Command

② → RW → low → 0 Write

③ → E → High → 1

④ → D₀ → D₇ (Command value)

⑤ → E → low → 0

RS

→ 0 → Com
→ 1 → data

RW

→ 0 → write
→ 1 → Read

→ step if you will send Command by 8 bit mode

→ need to send data From MCU (8 bit - Mode)

① RS → High → 1

② RW → low → 0

③ E → High → 1

④ Data value → D₀ → D₇

⑤ E → Low.
